Is LogMeIn compliant with PCI standards?

LogMeIn understands that security and adherence to PCI requirements are critical, and we fully support our customers' policies for ensuring their adherence to PCI-DSS compliance.

Our remote connectivity services only maintain limited session data associated with remote computers and does not retain or store any information, including any credit card data, from remote computers or any information transferred during a remote access session. Additionally, we protect all information transmitted with full, end-to-end 256-bit SSL encryption, the same encryption method endorsed by MasterCard, Visa and American Express. We also support PCI compliance with centralized user management, two-factor authentication for strong access control measures, and maintain secure physical and network security, with ongoing security monitoring & testing.
